

AI infrastructure is a physical system.

Capital moves first. Constraints decide what ships.

The margin pool can move upward.
The bottleneck stays physical.

A visual baseline for capacity,
compute, energy, and operating choice.

THE VALUE CHAIN IS PHYSICAL

**PHYSICAL
BEFORE DIGITAL**

Capacity only ships when the slowest layer arrives.

Land, energy, networking, and servers arrive on different clocks.

ARRIVAL ORDER

01

02

03

04

LAND

permitted + buildable
lead time $\neq$ demand

ENERGY

predictable supply
lead time $\neq$ demand

NETWORK

fabric + interconnect
lead time $\neq$ demand

SERVERS

GPU + components
lead time $\neq$ demand

THE SLOWEST LAYER SETS THE CLOCK.

CONSTRAINT

The dangerous asset is capacity you cannot use.

Risk appears when long lead time meets low utilization.

LEAD TIME ↑

UTILIZATION →

WATCH ITEM

Lead time can outlive demand.

Hold capacity as an option.
Prove demand before ownership.
